Poly-Dynamic Air-Suspension System™:

It combines the "isolator suspension" (fore & aft suspension) with the "air-suspension" system (vertical suspension).

Advantages are:

- Improved performance as both directions of the suspension are coherently integrated and therefore work together as one.

- Increased Comfort:

Because the ICP's (Inter Connecting Points) of the lower 2 seat-belt-mounting points move with both the vertical suspension and the isolator suspension during normal operation. And therefore there are no relative movements between the seat belt and the body of the seat occupant.

This drastically improves the seat belt wearing comfort and therefore automatically encourages seat belt use.

- Less moving parts which directly result in more stability and longer life cycles.

- Less noise: No rattling of the slide mechanism.
